Offsetting Account Determination

Use

According to Russian law, all accounting documents must be broken down so that each debit posting is matched to exactly one credit posting, and vice versa.

For example, when a supplier invoice is posted in the system, there is only one credit item for two debit items:

Account	Account Number	Debit Amount	Credit Amount
Goods receipt/invoice receipt	15	1000	
Deferred tax	19	180	
Accounts payable	60		1180

However according to Russian law, we are required to break down the debit item to create pairs of debits and credits to display turnovers between accounts, like so:

Account	Account Number	Debit Amount	Credit Amount
Goods receipt/invoice receipt	15	1000	
Accounts payable	60		1000
Deferred tax	19	180	
Accounts payable	60		180

This is the way this will look in legal reports:

Debit Account	Credit Account	Amount
15	60	1000
19	60	180

In the system, account clerks post all accounting documents as normal, and offsetting accounts are determined automatically.

Several legal reports require offsetting account determination to properly display turnovers between accounts, for example:

- Display Account Balances

For more information, see **Display Account Balances**.

- Cash Flow Statement
For more information, see [Cash Flow Statement](#).
- Accounting Statements
For more information, see [Accounting Statements](#).
- Price Difference Account Distribution
For more information, see [Price Difference Account Distribution](#).
- Memorial Order Creation
For more information, see [Memorial Order Creation Process](#).

Prerequisites

You have made the settings described in [Customizing for Offsetting Account Determination](#).

Procedure

The offsetting account determination solution works as follows:

1. When you post an accounting document, the system checks whether you have activated the new Offsetting Account Determination solution. If yes, then it proceeds to the next step.
2. If you set up grouping, the system groups document items according to your Customizing settings. For more information, see [Grouping of Document Items for Offsetting Account Determination](#).
3. After that, the system determines offsetting accounts for document item accounts. For more information, see [Account Pairing for Offsetting Account Determination](#).
4. If the offsetting account determination was not successful, the system will raise a message. If it was successful, the system will save the accounts and their turnovers and post the document.

Note

If the documents posted after offsetting account determination are incorrect, you need to reverse the incorrect documents, check your Customizing settings and post the documents again.

Activities

When you are posting the document, you can check how the system will determine offsetting accounts in the context menu under *Document -> Simulate General Ledger*. You can also click the *Expert Mode* pushbutton to preview the error messages that may be encountered during the offsetting account determination process.

After you have posted the document, you can display it to check the offsetting accounts and their turnovers. You can also use the Display Account Balances app to display offsetting accounts and their turnovers. For more information, see [Display Account Balances](#).

Customizing for Offsetting Account Determination

Make these settings before you can use the Offsetting Account Determination solution.

Grouping

If you want to group document items by certain fields before the system determines offsetting accounts, make the following settings:

1. Maintain which documents will be selected for grouping in Customizing for *Financial Accounting (New)* under *General Ledger Accounting (New)* -> *Periodic Processing* -> *Document* -> *Country Specifics* -> *Russia* -> *Online Offsetting Account Determination (New)* -> *Group Accounting Document Items*.
2. Define how the system groups document items from the selected documents before performing offsetting account determination. You can do this in Customizing for *Financial Accounting (New)* under *General Ledger Accounting (New)* -> *Periodic Processing* -> *Document* -> *Country Specifics* -> *Russia* -> *Online Offsetting Account Determination (New)* -> *Define Field Sets for Grouping*.

For more information on grouping, see [Grouping of Document Items for Offsetting Account Determination](#).

Versions of Offsetting Account Determination Rules

Versions of offsetting account determination rules define how the system determines offsetting accounts. For each version, you define:

- Whether the system groups document items before determining offsetting accounts
- Whether specific account pairs have higher priority over others
- Whether some accounts are forbidden to be paired with others as offsetting accounts

You can define these versions in Customizing for *Financial Accounting (New)* under *General Ledger Accounting (New)* -> *Periodic Processing* -> *Document* -> *Country Specifics* -> *Russia* -> *Online Offsetting Account Determination (New)* -> *Define Offsetting Account Determination Versions*.

For more information on account pairing, see [Account Pairing for Offsetting Account Determination](#).

Activate Offsetting Account Determination

Activate Offsetting Account Determination for specific ledgers and assign versions of offsetting account determination rules in Customizing for *Financial Accounting (New)* under *General Ledger Accounting (New)* -> *Periodic Processing* -> *Document* -> *Country Specifics* -> *Russia* -> *Online Offsetting Account Determination (New)* -> *Activate Online Offsetting Account Determination*.

Please note that when you activate Offsetting Account Determination, you can choose whether the system will use the first in, first out (FIFO) approach to offsetting account determination on the Define Version screen of this Customizing activity. For an explanation of how this affects document posting, see [Account Pairing for Offsetting Account Determination](#).

Grouping of Document Items for Offsetting Account Determination

You can define how the system groups document items before performing offsetting account determination. To do this, follow the procedure:

1. Create logical rules in Customizing for *Financial Accounting (New)* under *General Ledger Accounting (New)* -> *Periodic Processing* -> *Document* -> *Country Specifics* -> *Russia* -> *Online Offsetting Account Determination (New)* -> *Group Accounting Document Items*.

These rules define which documents will be processed, for example:

Grouping Activation Rule	Rule
1	Document Type (BLART) = 'SA' AND Reference Transaction (AWTYP) = 'RMRP'
2	Document Type (BLART) = 'AB'

In this case, the system will group two different types of documents:

- According to rule 1, the system will group document items for documents with document type SA and reference transaction RMRP.
 - According to rule 2, the system will group document items for documents with document type AB.
2. Define how the system will group document items in Customizing for *Financial Accounting (New)* under *General Ledger Accounting (New)* -> *Periodic Processing* -> *Document* -> *Country Specifics* -> *Russia* -> *Online Offsetting Account Determination (New)* -> *Define Field Sets for Grouping*.

Here you create sets of fields for grouping of document items. To do so, create a grouping set on the *Define Grouping Sets* screen and then enter fields from the *Universal Journal Entry Line Items* (ACDOCA) table to group document items by on the *Fields* screen. You can also specify several fields and choose the order in which they will be applied. For example:

Order	Field
1	Business Area (GSBER)
2	Material (MATNR)

In this case, the system will first form groups of document items that have the same Business Area, and then form groups of document items that have the same Material inside those groups.

If the system processes this document:

Item	Account	Business Area	Material	Debit	Credit
1	Account 1	Business Area 1	Material 1	2,300.00	
2	Account 2	Business Area 1	Material 1		2,300.00
3	Account 1	Business Area 2	Material 1	1,600.00	
4	Account 2	Business Area 2	Material 1		1,600.00
5	Account 1	Business Area 1	Material 2	1,200.00	
6	Account 2	Business Area 1	Material 2		1,200.00

Then the system will first create two document item groups:

1. Group with Business Area 1
2. Group with Business Area 2

And then it will create two groups of document items in Group with Business Area 1:

1. Group with Business Area 1, Material 1
2. Group with Business Area 1, Material 2
3. Group with Business Area 2

So, the system will determine offsetting accounts separately for the following document item groups:

Group	Item	Account	Business Area	Material	Debit	Credit
1	1	Account 1	Business Area 1	Material 1	2,300.00	
1	2	Account 2	Business Area 1	Material 1		2,300.00
2	3	Account 1	Business Area 1	Material 2	1,200.00	
2	4	Account 2	Business Area 1	Material 2		1,200.00
3	5	Account 1	Business Area 2	Material 1	1,600.00	
3	6	Account 2	Business Area 2	Material 1		1,600.00

3. When defining versions of offsetting account determination rules, specify the grouping rules and grouping field sets you created. You can do this in Customizing for *Financial Accounting (New)* under *General Ledger Accounting (New)* -> *Periodic Processing* -> *Document* -> *Country Specifics* -> *Russia* -> *Online Offsetting Account Determination (New)* -> *Define Offsetting Account Determination Versions*, on the *Assign Grouping Rules* screen.

Note

Please note that if you define overlapping grouping rules with different grouping field sets, the document items that are selected by several rules will be processed only according to the first one. For example, if you have defined the following rules:

Grouping Rule	Rule
1	Reference Transaction (AWTYP) = 'BKPF'
2	Document Type (BLART) = 'KR' AND Reference Transaction (AWTYP) = 'BKPF'

And then you assigned them to the following grouping field sets:

Grouping Rule	Group Set
1	SET1
2	SET2

And you have two documents with the following parameters:

Document	Document Type	Reference Transaction
1	KR	BKPF
2	DR	BKPF

Then both documents will be grouped according to field set SET1, document 1 applies to rule 1 and 2, but rule 1 is the first one.

Account Pairing for Offsetting Account Determination

You can change how the system determines offsetting accounts in Customizing for *Financial Accounting (New)* under *General Ledger Accounting (New)* -> *Periodic Processing* -> *Document* -> *Country Specifics* -> *Russia* -> *Online Offsetting Account Determination (New)* -> *Define Offsetting Account Determination Versions*.

The system processes document items of whole documents or of groups of document items if you set up grouping. For more information on grouping, see [Grouping of Document Items for Offsetting Account Determination](#).

For the selected document items, the system tries to determine the offsetting account for the G/L account of the item. The system determines offsetting accounts as follows:

1. First, the system checks if you have defined forbidden account pairs.
If you did and there are forbidden offsetting accounts for this G/L account, then the system will determine offsetting accounts for this G/L account first. When doing so, it will avoid the forbidden offsetting accounts. If there are preferred offsetting accounts for this G/L account, they will have higher priority than others.
2. After the system has determined all offsetting accounts for G/L accounts from forbidden pairs (if any), the system checks if you have defined preferred account pairs.
If you did then the system will use the offsetting account that has the highest priority, starting with offsetting accounts from preferred account pairs. Note that if you use wildcards, the more specific the preferred account number is, the higher priority it will have.
3. If there are no preferred account pairs, then the system will use the first available item on the opposite side (debit item corresponds with credit, credit item corresponds with debit) to determine the offsetting account.
4. If there is a remaining amount in the document item, then the system selects the next available item on the opposite side.
5. Then the system does the same for the remaining document items.
6. If the system determined offsetting accounts for all document items successfully, it posts the document. If not, then there are two possibilities.

When you activated Offsetting Account Determination in Customizing for *Financial Accounting (New)* under *General Ledger Accounting (New)* -> *Periodic Processing* -> *Document* -> *Country Specifics* -> *Russia* -> *Online Offsetting Account Determination (New)* -> *Activate Online Offsetting Account Determination*, you had the option to allow the *first in, first out* (FIFO) approach to Offsetting Account Determination or not. Based on your settings there, the system will proceed differently.

FIFO not Allowed

If you do not use the FIFO approach, at this point the system will raise a message and will cancel document posting. This may require more maintenance from the accounting clerks but will help ensure there are no incorrect account pairs.

FIFO Allowed

If you use the FIFO approach, at this point the system will start determining offsetting accounts from step 1, but now it will ignore all your version settings: item grouping, account

priorities and forbidden account pairs. This will require less maintenance from the accounting clerks but may lead to incorrect account pairs.

Example

For example, here is how the system can determine offsetting accounts for a Customer Invoice. Before processing:

RLDNR Ledger in General Ledger Accounting	DOCLN Six- Character Posting Item for Ledger	RACCT Account Number	DRCRK Debit/Credit Indicator	BUZEI Number of Line Item Within Accounting Document	HSL Amount in Company Code Currency	GKONT Offsetting Account Number
0L	1	62001100	S	1	1180	
0L	2	90100000	H	2	1000	
0L	3	68020220	H	3	180	
0L	4	90100000	H	4	180	
0L	5	90103000	S	5	180	

After processing:

RLDNR Ledger in General Ledger Accounting	DOCLN Six- Character Posting Item for Ledger	RACCT Account Number	DRCRK Debit/Credit Indicator	BUZEI Number of Line Item Within Accounting Document	HSL Amount in Company Code Currency	GKONT Offsetting Account Number
0L	1	62001100	S	1	1000	2
0L	2	90100000	H	2	1000	1
0L	3	62001100	S	1	180	4
0L	4	90100000	H	4	180	3
0L	5	90103000	S	5	180	6
0L	6	68020220	H	3	180	5

Display Account Balances

With this app you can check General Ledger account balances and their offsetting accounts and their turnovers. You can use this data to make sure that your legal reports that include account turnovers are correct.

Key Features

You can use this app to display turnovers for specific ledgers in specific periods.

This app uses the C_RU_GLAacctBalanceQuery CDS view.

Supported Device Types

- Desktop
- Tablet
- Smartphone

Selection Parameters

When you start a new report run, the system displays the following selection parameters:

- Ledger
- Company Code
- Posting Date From
- Posting Date To
- Display Currency
- G/L Account Grouping

Here you can choose whether the app will display full account numbers or group it by first symbols. For example, accounts 15101000 and 15102000, if grouped by first 2 symbols, will be displayed as one 15 grouped G/L account.

This setting is also applied to the offsetting accounts.
- Display Alt. Account

Here you can choose whether the app will display the G/L account or the alternative G/L account for the journal entries.
- Zero Turnover Accts

Here you can choose whether the app will display accounts that have zero turnovers in the selected periods.
- Fiscal Year
- Journal Entry
- G/L Account
- Offsetting Account

Output

As report output, the app generates a display table that contains the starting balance, ending balance and turnovers between G/L accounts and their offsetting accounts.

For every G/L account or account group, the first line always contains an asterisk (*) in the *Grouped Offsetting Account* field. This line contains only the starting and ending balance for the selected period.

If the app also selected documents which contains items that do not have offsetting accounts determined for them, turnovers for those documents are also included in the last line for every G/L account or account group. This line contains a hashtag sign (#) in the *Grouped Offsetting Account* field.
